Multivariate Distributions

1

2.1.6. Let $f(x,y) = e^{-x-y}$, $0 < x < \infty$, $0 < y < \infty$, zero elsewhere, be the pdf of X and Y. Then if Z = X + Y, compute $P(Z \le 0)$, $P(Z \le 6)$, and, more generally, $P(Z \le 2)$, for $0 < z < \infty$. What is the pdf of Z?

2.1.7. Let X and Y have the pdf f(x,y) = 1, 0 < x < 1, 0 < y < 1, zero elsewhere. Find the cdf and pdf of the product Z = XY.

2

2.2.1. If $p(x_1, x_2) = (\frac{2}{3})^{x_1 + x_2} (\frac{1}{3})^{2 - x_1 - x_2}$, $(x_1, x_2) = (0, 0), (0, 1), (1, 0), (1, 1)$, zero elsewhere, is the joint pmf of X_1 and X_2 , find the joint pmf of $Y_1 = X_1 - X_2$ and $Y_2 = X_1 + X_2$.

2.2.2. Let X_1 and X_2 have the joint pmf $p(x_1, x_2) = x_1x_2/36$, $x_1 = 1, 2, 3$ and $x_2 = 1, 2, 3$, zero elsewhere. Find first the joint pmf of $Y_1 = X_1X_2$ and $Y_2 = X_2$, and then find the marginal pmf of Y_1 .

3

2.3.2. Let $f_{1|2}(x_1|x_2) = c_1x_1/x_2^2$, $0 < x_1 < x_2$, $0 < x_2 < 1$, zero elsewhere, and $f_2(x_2) = c_2x_2^4$, $0 < x_2 < 1$, zero elsewhere, denote, respectively, the conditional pdf of X_1 , given $X_2 = x_2$, and the marginal pdf of X_2 . Determine:

- (a) The constants c_1 and c_2 .
- (b) The joint pdf of X_1 and X_2 .
- (c) $P(\frac{1}{4} < X_1 < \frac{1}{2} | X_2 = \frac{5}{8}).$
- (d) $P(\frac{1}{4} < X_1 < \frac{1}{2})$.

2.3.3. Let $f(x_1, x_2) = 21x_1^2x_2^3$, $0 < x_1 < x_2 < 1$, zero elsewhere, be the joint pdf of X_1 and X_2 .

- (a) Find the conditional mean and variance of X_1 , given $X_2 = x_2$, $0 < x_2 < 1$.
- (b) Find the distribution of $Y = E(X_1|X_2)$.
- (c) Determine E(Y) and Var(Y) and compare these to $E(X_1)$ and $Var(X_1)$, respectively.

2.3.8. Let X and Y have the joint pdf $f(x,y) = 2 \exp\{-(x+y)\}$, $0 < x < y < \infty$, zero elsewhere. Find the conditional mean E(Y|x) of Y, given X = x.

2.4.7. If the correlation coefficient ρ of X and Y exists, show that $-1 \le \rho \le 1$. *Hint:* Consider the discriminant of the nonnegative quadratic function

$$h(v) = E\{[(X - \mu_1) + v(Y - \mu_2)]^2\},\$$

where v is real and is not a function of X nor of Y.

2.4.11. Let $\sigma_1^2 = \sigma_2^2 = \sigma^2$ be the common variance of X_1 and X_2 and let ρ be the correlation coefficient of X_1 and X_2 . Show for k > 0 that

$$P[|(X_1 - \mu_1) + (X_2 - \mu_2)| \ge k\sigma] \le \frac{2(1+\rho)}{k^2}.$$

5

2.5.4. Find $P(0 < X_1 < \frac{1}{3}, 0 < X_2 < \frac{1}{3})$ if the random variables X_1 and X_2 have the joint pdf $f(x_1, x_2) = 4x_1(1 - x_2)$, $0 < x_1 < 1$, $0 < x_2 < 1$, zero elsewhere.

2.5.9. Suppose that a man leaves for work between 8:00 a.m. and 8:30 a.m. and takes between 40 and 50 minutes to get to the office. Let X denote the time of departure and let Y denote the time of travel. If we assume that these random variables are independent and uniformly distributed, find the probability that he arrives at the office before 9:00 a.m.

6

2.6.3. Let X_1, X_2, X_3 , and X_4 be four independent random variables, each with pdf $f(x) = 3(1-x)^2$, 0 < x < 1, zero elsewhere. If Y is the minimum of these four variables, find the cdf and the pdf of Y.

Hint:
$$P(Y > y) = P(X_i > y, i = 1, ..., 4)$$
.

2.6.9. Let X_1, X_2, X_3 be iid with common pdf $f(x) = \exp(-x), \ 0 < x < \infty$, zero elsewhere. Evaluate:

(a)
$$P(X_1 < X_2 | X_1 < 2X_2)$$
.

2.7.1. Let X_1, X_2, X_3 be iid, each with the distribution having pdf $f(x) = e^{-x}$, $0 < x < \infty$, zero elsewhere. Show that

$$Y_1 = \frac{X_1}{X_1 + X_2}, \quad Y_2 = \frac{X_1 + X_2}{X_1 + X_2 + X_3}, \quad Y_3 = X_1 + X_2 + X_3$$

are mutually independent.

2.7.2. If $f(x) = \frac{1}{2}$, -1 < x < 1, zero elsewhere, is the pdf of the random variable X, find the pdf of $Y = X^2$.

8

2.8.2. Let X_1, X_2, X_3, X_4 be four iid random variables having the same pdf f(x) = 2x, 0 < x < 1, zero elsewhere. Find the mean and variance of the sum Y of these four random variables.

2.8.4. If the independent variables X_1 and X_2 have means μ_1 , μ_2 and variances σ_1^2 , σ_2^2 , respectively, show that the mean and variance of the product $Y = X_1 X_2$ are $\mu_1 \mu_2$ and $\sigma_1^2 \sigma_2^2 + \mu_1^2 \sigma_2^2 + \mu_2^2 \sigma_1^2$, respectively.

Some Special Distributions

1

3.1.2. The mgf of a random variable X is $(\frac{2}{3} + \frac{1}{3}e^t)^9$. Show that

$$P(\mu - 2\sigma < X < \mu + 2\sigma) = \sum_{x=1}^{5} {9 \choose x} \left(\frac{1}{3}\right)^x \left(\frac{2}{3}\right)^{9-x}.$$

3.1.3. If X is b(n, p), show that

$$E\left(\frac{X}{n}\right) = p$$
 and $E\left[\left(\frac{X}{n} - p\right)^2\right] = \frac{p(1-p)}{n}$.

3.1.11. Let X be b(2,p) and let Y be b(4,p). If $P(X \ge 1) = \frac{5}{9}$, find $P(Y \ge 1)$.

3.1.12. If x = r is the unique mode of a distribution that is b(n, p), show that

$$(n+1)p-1 < r < (n+1)p.$$

Hint: Determine the values of x for which the ratio p(x+1)/p(x) > 1.

- **3.1.18.** If a fair coin is tossed at random five independent times, find the conditional probability of five heads given that there are at least four heads.
- **3.1.19.** Let an unbiased die be cast at random seven independent times. Compute the conditional probability that each side appears at least once given that side 1 appears exactly twice.

2

- **3.2.1.** If the random variable X has a Poisson distribution such that P(X = 1) = P(X = 2), find P(X = 4).
- **3.2.4.** Let the pmf p(x) be positive on and only on the nonnegative integers. Given that p(x) = (4/x)p(x-1), $x = 1, 2, 3, \ldots$, find the formula for p(x). Hint: Note that p(1) = 4p(0), $p(2) = (4^2/2!)p(0)$, and so on. That is, find each p(x) in terms of p(0) and then determine p(0) from

$$1 = p(0) + p(1) + p(2) + \cdots$$

3.2.12. Let X have a Poisson distribution with mean 1. Compute, if it exists, the expected value E(X!).

3

3.3.9. Let X have a gamma distribution with parameters α and β . Show that $P(X \ge 2\alpha\beta) \le (2/e)^{\alpha}$.

Hint: Use the result of Exercise 1.10.4.

3.3.15. Let X have a Poisson distribution with parameter m. If m is an experimental value of a random variable having a gamma distribution with $\alpha = 2$ and $\beta = 1$, compute P(X = 0, 1, 2).

Hint: Find an expression that represents the joint distribution of X and m. Then integrate out m to find the marginal distribution of X.

3.3.16. Let X have the uniform distribution with pdf f(x) = 1, 0 < x < 1, zero elsewhere. Find the cdf of $Y = -2 \log X$. What is the pdf of Y?

3.4.1. If

$$\Phi(z) = \int_{-\infty}^{z} \frac{1}{\sqrt{2\pi}} e^{-w^2/2} dw,$$

show that $\Phi(-z) = 1 - \Phi(z)$.

3.4.4. Let X be $N(\mu, \sigma^2)$ so that P(X < 89) = 0.90 and P(X < 94) = 0.95. Find μ and σ^2 .

3.4.5. Show that the constant c can be selected so that $f(x) = c2^{-x^2}$, $-\infty < x < \infty$, satisfies the conditions of a normal pdf. *Hint:* Write $2 = e^{\log 2}$.

3.4.12. Let X be N(5,10). Find $P[0.04 < (X-5)^2 < 38.4]$.

3.4.13. If X is N(1,4), compute the probability $P(1 < X^2 < 9)$.

3.4.22. Let f(x) and F(x) be the pdf and the cdf, respectively, of a distribution of the continuous type such that f'(x) exists for all x. Let the mean of the truncated distribution that has pdf g(y) = f(y)/F(b), $-\infty < y < b$, zero elsewhere, be equal to -f(b)/F(b) for all real b. Prove that f(x) is a pdf of a standard normal distribution.

5

3.5.5. Let X and Y have a bivariate normal distribution with parameters $\mu_1 = 5$, $\mu_2 = 10$, $\sigma_1^2 = 1$, $\sigma_2^2 = 25$, and $\rho > 0$. If P(4 < Y < 16|X = 5) = 0.954, determine ρ .

$$f(x,y) = (1/2\pi) \exp\left[-\frac{1}{2}(x^2 + y^2)\right] \left\{1 + xy \exp\left[-\frac{1}{2}(x^2 + y^2 - 2)\right]\right\},$$

where $-\infty < x < \infty$, $-\infty < y < \infty$. If f(x,y) is a joint pdf, it is not a normal bivariate pdf. Show that f(x,y) actually is a joint pdf and that each marginal pdf is normal. Thus the fact that each marginal pdf is normal does not imply that the joint pdf is bivariate normal.

3.5.9. Let X, Y, and Z have the joint pdf

$$\left(\frac{1}{2\pi}\right)^{3/2} \exp\left(-\frac{x^2 + y^2 + z^2}{2}\right) \left[1 + xyz \exp\left(-\frac{x^2 + y^2 + z^2}{2}\right)\right],$$

where $-\infty < x < \infty$, $-\infty < y < \infty$, and $-\infty < z < \infty$. While X, Y, and Z are obviously dependent, show that X, Y, and Z are pairwise independent and that each pair has a bivariate normal distribution.

6

3.6.8. Let F have an F-distribution with parameters r_1 and r_2 . Argue that 1/F has an F-distribution with parameters r_2 and r_1 .

3.6.12. Show that

$$Y = \frac{1}{1 + (r_1/r_2)W},$$

where W has an F-distribution with parameters r_1 and r_2 , has a beta distribution.

3.6.13. Let X_1 , X_2 be iid with common distribution having the pdf $f(x) = e^{-x}$, $0 < x < \infty$, zero elsewhere. Show that $Z = X_1/X_2$ has an F-distribution.

7

- **3.7.3.** Consider the mixture distribution, (9/10)N(0,1)+(1/10)N(0,9). Show that its kurtosis is 8.34.
- **3.7.4.** Let X have the conditional geometric pmf $\theta(1-\theta)^{x-1}$, $x=1,2,\ldots$, where θ is a value of a random variable having a beta pdf with parameters α and β . Show that the marginal (unconditional) pmf of X is

$$\frac{\Gamma(\alpha+\beta)\Gamma(\alpha+1)\Gamma(\beta+x-1)}{\Gamma(\alpha)\Gamma(\beta)\Gamma(\alpha+\beta+x)}, \quad x=1,2,\ldots.$$

If $\alpha = 1$, we obtain

$$\frac{\beta}{(\beta+x)(\beta+x-1)}, \quad x=1,2,\ldots,$$

which is one form of Zipf's law.

Some Elementary Statistical Inferences

1

- **4.1.5.** Let X_1, X_2, \ldots, X_n be a random sample from a continuous-type distribution.
- (a) Find $P(X_1 \le X_2), P(X_1 \le X_2, X_1 \le X_3), \dots, P(X_1 \le X_i, i = 2, 3, \dots, n)$.
- (b) Suppose the sampling continues until X_1 is no longer the smallest observation (i.e., $X_j < X_1 \le X_i, i = 2, 3, ..., j-1$). Let Y equal the number of trials, not including X_1 , until X_1 is no longer the smallest observation (i.e., Y = j 1). Show that the distribution of Y is

$$P(Y = y) = \frac{1}{y(y+1)}, \quad y = 1, 2, 3, \dots$$

4.1.8. Recall that for the parameter $\eta = g(\theta)$, the mle of η is $g(\widehat{\theta})$, where $\widehat{\theta}$ is the mle of θ . Assuming that the data in Example 4.1.6 were drawn from a Poisson distribution with mean λ , obtain the mle of λ and then use it to obtain the mle of the pmf. Compare the mle of the pmf to the nonparametric estimate. Note: For the domain value 6, obtain the mle of $P(X \ge 6)$.

2

- **4.2.10.** Let X_1, X_2, \ldots, X_9 be a random sample of size 9 from a distribution that is $N(\mu, \sigma^2)$.
 - (a) If σ is known, find the length of a 95% confidence interval for μ if this interval is based on the random variable $\sqrt{9}(\overline{X} \mu)/\sigma$.
 - (b) If σ is unknown, find the expected value of the length of a 95% confidence interval for μ if this interval is based on the random variable $\sqrt{9}(\overline{X} \mu)/S$. Hint: Write $E(S) = (\sigma/\sqrt{n-1})E[((n-1)S^2/\sigma^2)^{1/2}]$.
- **4.2.11.** Let $X_1, X_2, \ldots, X_n, X_{n+1}$ be a random sample of size n+1, n>1, from a distribution that is $N(\mu, \sigma^2)$. Let $\overline{X} = \sum_{1}^{n} X_i/n$ and $S^2 = \sum_{1}^{n} (X_i \overline{X})^2/(n-1)$. Find the constant c so that the statistic $c(\overline{X} X_{n+1})/S$ has a t-distribution. If n=8, determine k such that $P(\overline{X} kS < X_9 < \overline{X} + kS) = 0.80$. The observed interval $(\overline{x} ks, \overline{x} + ks)$ is often called an 80% **prediction interval** for X_9 .
- **4.2.19.** Let X_1, X_2, \ldots, X_n be a random sample from a gamma distribution with known parameter $\alpha = 3$ and unknown $\beta > 0$. Discuss the construction of a confidence interval for β .

Hint: What is the distribution of $2\sum_{i=1}^{n} X_i/\beta$? Follow the procedure outlined in Exercise 4.2.18.

4.2.26. Let \overline{X} and \overline{Y} be the means of two independent random samples, each of size n, from the respective distributions $N(\mu_1, \sigma^2)$ and $N(\mu_2, \sigma^2)$, where the common variance is known. Find n such that

$$P(\overline{X} - \overline{Y} - \sigma/5 < \mu_1 - \mu_2 < \overline{X} - \overline{Y} + \sigma/5) = 0.90.$$

3

4.4.5. Let $Y_1 < Y_2 < Y_3 < Y_4$ be the order statistics of a random sample of size 4 from the distribution having pdf $f(x) = e^{-x}$, $0 < x < \infty$, zero elsewhere. Find $P(Y_4 \ge 3)$.

4.4.11. Find the probability that the range of a random sample of size 4 from the uniform distribution having the pdf f(x) = 1, 0 < x < 1, zero elsewhere, is less than $\frac{1}{2}$.

4.4.12. Let $Y_1 < Y_2 < Y_3$ be the order statistics of a random sample of size 3 from a distribution having the pdf f(x) = 2x, 0 < x < 1, zero elsewhere. Show that $Z_1 = Y_1/Y_2$, $Z_2 = Y_2/Y_3$, and $Z_3 = Y_3$ are mutually independent.

4.4.17. Let $Y_1 < Y_2 < Y_3 < Y_4$ be the order statistics of a random sample of size n = 4 from a distribution with pdf f(x) = 2x, 0 < x < 1, zero elsewhere.

- (a) Find the joint pdf of Y_3 and Y_4 .
- (b) Find the conditional pdf of Y_3 , given $Y_4 = y_4$.
- (c) Evaluate $E(Y_3|y_4)$.

4.4.24. Let Y_n denote the nth order statistic of a random sample of size n from a distribution of the continuous type. Find the smallest value of n for which the inequality $P(\xi_{0.9} < Y_n) \ge 0.75$ is true.

5

4.5.3. Let X have a pdf of the form $f(x;\theta) = \theta x^{\theta-1}$, 0 < x < 1, zero elsewhere, where $\theta \in \{\theta : \theta = 1, 2\}$. To test the simple hypothesis $H_0 : \theta = 1$ against the alternative simple hypothesis $H_1 : \theta = 2$, use a random sample X_1, X_2 of size n = 2 and define the critical region to be $C = \{(x_1, x_2) : \frac{3}{4} \le x_1 x_2\}$. Find the power function of the test.

- **4.5.8.** Let us say the life of a tire in miles, say X, is normally distributed with mean θ and standard deviation 5000. Past experience indicates that $\theta = 30,000$. The manufacturer claims that the tires made by a new process have mean $\theta > 30,000$. It is possible that $\theta = 35,000$. Check his claim by testing $H_0: \theta = 30,000$ against $H_1: \theta > 30,000$. We observe n independent values of X, say x_1, \ldots, x_n , and we reject H_0 (thus accept H_1) if and only if $\overline{x} \geq c$. Determine n and c so that the power function $\gamma(\theta)$ of the test has the values $\gamma(30,000) = 0.01$ and $\gamma(35,000) = 0.98$.
- **4.5.12.** Let X_1, X_2, \ldots, X_8 be a random sample of size n = 8 from a Poisson distribution with mean μ . Reject the simple null hypothesis $H_0: \mu = 0.5$ and accept $H_1: \mu > 0.5$ if the observed sum $\sum_{i=1}^8 x_i \geq 8$.
 - (a) Compute the significance level α of the test.
 - (b) Find the power function $\gamma(\mu)$ of the test as a sum of Poisson probabilities.
 - (c) Using Table I of Appendix C, determine $\gamma(0.75)$, $\gamma(1)$, and $\gamma(1.25)$.

6

- **4.6.2.** Consider the power function $\gamma(\mu)$ and its derivative $\gamma'(\mu)$ given by (4.6.5) and (4.6.6). Show that $\gamma'(\mu)$ is strictly negative for $\mu < \mu_0$ and strictly positive for $\mu > \mu_0$.
- **4.6.5.** Assume that the weight of cereal in a "10-ounce box" is $N(\mu, \sigma^2)$. To test $H_0: \mu = 10.1$ against $H_1: \mu > 10.1$, we take a random sample of size n = 16 and observe that $\overline{x} = 10.4$ and s = 0.4.
- (a) Do we accept or reject H_0 at the 5% significance level?
- **(b)** What is the approximate *p*-value of this test?
- **4.6.7.** Among the data collected for the World Health Organization air quality monitoring project is a measure of suspended particles in $\mu g/m^3$. Let X and Y equal the concentration of suspended particles in $\mu g/m^3$ in the city center (commercial district) for Melbourne and Houston, respectively. Using n=13 observations of X and m=16 observations of Y, we test $H_0: \mu_X = \mu_Y$ against $H_1: \mu_X < \mu_Y$.
 - (a) Define the test statistic and critical region, assuming that the unknown variances are equal. Let α = 0.05.
- (b) If $\overline{x} = 72.9$, $s_x = 25.6$, $\overline{y} = 81.7$, and $s_y = 28.3$, calculate the value of the test statistic and state your conclusion.

- **4.7.1.** A number is to be selected from the interval $\{x: 0 < x < 2\}$ by a random process. Let $A_i = \{x: (i-1)/2 < x \le i/2\}$, i = 1, 2, 3, and let $A_4 = \{x: \frac{3}{2} < x < 2\}$. For i = 1, 2, 3, 4, suppose a certain hypothesis assigns probabilities p_{i0} to these sets in accordance with $p_{i0} = \int_{A_i} (\frac{1}{2})(2-x) dx$, i = 1, 2, 3, 4. This hypothesis (concerning the multinomial pdf with k = 4) is to be tested at the 5% level of significance by a chi-square test. If the observed frequencies of the sets A_i , i = 1, 2, 3, 4, are respectively, 30, 30, 10, 10, would H_0 be accepted at the (approximate) 5% level of significance?
- **4.7.3.** A die was cast n = 120 independent times and the following data resulted:

If we use a chi-square test, for what values of b would the hypothesis that the die is unbiased be rejected at the 0.025 significance level?

4.7.7. A certain genetic model suggests that the probabilities of a particular trinomial distribution are, respectively, $p_1 = p^2$, $p_2 = 2p(1-p)$, and $p_3 = (1-p)^2$, where $0 . If <math>X_1, X_2, X_3$ represent the respective frequencies in n independent trials, explain how we could check on the adequacy of the genetic model.
